Abstract : At the Belorussian Experimental Station for Animal Husbandry (in Drisskiy Rayon of Vitebskaya Oblast') in 1954-1955 a large number of corn varieties obtained from diverse rayons of the USSR were tested. In 1954 there were 8 varieties in the test, in 1955 there were 37 varieties. The 1955 corn variety testing showed that for the northern portion of the Belorussian SSR the most suitable varieties for green forage and ensilage will be in part those late ripening varieties which yield the largest quantity of feed units in the green

TITLE: General problems and study of the man-automaton system

SOURCE: Sistema chelovek i avtomat (Man-automaton systems). Moscow, Izd-vo Nauka, 1965, 5-15

TOPIC TAGS: bionics, man machine communication, information theory, computer technology

ABSTRACT: The authors study the basic problems which differentiate the man-automaton system from the general class of cybernetic systems. Man-automaton systems are classified according to purpose, the human role and the nature of information exchange between man and machine. The distribution of functions between man and automaton is considered. A general formula is given for calculating this relationship:

$$I = f(I_1, I_2, \dots, I_n) \approx \sum_{i=1}^n \alpha_i I_i$$

where I_1, I_2, \dots, I_n are estimates according to the individual indexes; $\alpha_1, \alpha_2, \dots, \alpha_n$

Card 1/2

L 37108-66

ACC NR: AT6012882

are the weighting coefficients. These coefficients characterize the relative importance of the individual estimates for selecting the optimal distribution of functions. The individual estimates should include such things as the efficiency of control, its reliability, equipment cost, and operating expenditure. The inclusion of man in the system requires a thorough knowledge of all aspects of human behavior. The functional capabilities of man under diverse conditions and environments are studied. Important factors are the amount of information that a man can handle, the properties and the capabilities of human analyzers, and their characteristics during the simultaneous use of several sensory organs. The automatic part of the man-automaton system is studied. This part has to be designed for working in unison with man and with respect to man's capabilities. This includes the study and development of optimal forms of communication between man and machine. The incorporation into the system of existing remote control and computer equipment is considered. Four problems in methodology are discussed: improving the classification of man-automaton systems; the establishment of an experimental basis and development of study methods; simulating the man-automaton system under various operating conditions; and training personnel for the man-automaton systems. In order to solve these problems extensive study must be made of man's learning, simulation of this process, and the development of learning models, programs, and other equipment. Orig. art. has: 1 formula.

Gabadadze, N. A. On the application of complex and hypercomplex numbers to the theory of rectilinear congruences. *Sovetsk. Akad. Nauk* (Russian), 1954, 641-645.

Following proposals of B. A. Rozenfeld (Trudy Azerbaidzhansk. Gos. Univ. 1 (1952), 31-38, unavailable to the reviewer); One hundred and twenty-five years of the non-Euclidean geometry of Lobachevskii (1826-1953). Gostekhizdat, Moscow-Leningrad, 1952, pp. 151-152, MK 15, 148] points of the absolute of the space S_3 for which $-(x^0)^2 + (x^1)^2 + (x^2)^2 = 0$ are represented by

$$z = (x^1 + ix^2)/(x^0 - x^2)$$

(this was already proposed by F. Klein), and points of the absolute of the space S_3 for which $-(x^0)^2 + (x^1)^2 - (x^2)^2 = 0$ are represented by $z = (x^1 - ix^2)/(x^0 - x^2)$, where $i^2 = -1$ and $e^2 = +1$. Since every line marks out two points on the absolute, a function $z = f(t)$ determines a rectilinear congruence. Expressions are given for the distribution parameter of lines of the congruence and other quantities, also for line congruences in projective P_3 , where a related representation is possible with two-way matrices instead of complex or dual numbers. TITLE: The model of the ring proton synchrotron

PERIODICAL: Atomnaya energiya, v. 9, no. 6, 1960, 491-493

TEXT: The ring proton synchrotron which is a powerful focusing accelerator with a magnetic field constant with respect to time, has been suggested in 1953 by A. A. Kolomenskiy, V. A. Petukhov, and M.S.Rabinovich and, independently of them, in 1955 by Symon (Phys.Rev. 98, 1152 (1955)). X
The new device seems to be able to produce very intensive accelerated-particle beams. A model of this ring synchrotron (with radial sectors) has been constructed in the Ob"yedinennyy institut yadernykh issledovaniy (Joint Institute of Nuclear Research). The electromagnet consists of eight elements arranged periodically, each of which has a direct and an inverse sector; it also has two straight sections. The azimuthal

Card 1/3

22447

The model of the ring...

S/089/60/009/006/007/011
B102/B212

dimension of the direct sector, which focuses the beam in radial direction, is $22^{\circ}30'$, and that of the inverse sector, which brings about the vertical focusing, is $7^{\circ}30'$. The inverse sectors cause the orbital perimeter of the ring synchrotron to be bigger than that of a standard strongly focusing accelerator. The ratio of the maximum radius of the orbit to the minimum radius of curvature is approximately equal to 3. The coils generating the field are arranged such that the magnetic field increases with the radius of the orbit according to $H = H_0 (R/R_0)^4$, i.e., it increases from 42 oe at $R = 35$ cm to 340 oe at $R = 59$ cm. The magnet exhibits the characteristic that the gap between its poles increases in proportion to the gap radius. Therefore, the vertical dimensions of the working area will also change from 2 to 4 cm. The increase of all geometrical dimensions of the sectors and the constancy of the field index k (the field index of the model is equal to 4) bring about a dynamic similarity of the orbits, and the frequency of the free oscillations will also be constant. The number of betatron oscillations per circulation may be varied from 1 to 3 in the vertical direction, and from 2.5 to 3.5 in the radial direction. The model is especially suited for

Card 2/3

The model of the ring...

S/089/60/009/006/007/011
B102/B212

electron acceleration; the injection (of 20-40 kev electrons) may be done continuously or in a pulsed manner. The acceleration is done with an electric rotational field having a voltage of 10 to 20 v per circulation and a frequency of 450-500 cps. The first test results obtained from this unit showed that it is very sensitive with regard to the accuracy of collection and the stability of the principal magnetic characteristics. There are 2 figures and 7 references: 5 Soviet-bloc and 2 non-Soviet-bloc. The two references to English-language publications read as follows: K. Symon. Phys.Rev. 98, 1152 (1955); T. Ohkawa. Annular proton synchrotron with ...

Final radius	54 cm
Vertical dimension of the chamber for the initial radius	10 cm
Coefficient k for which $H = H_0 (r/r_0)^k f(\theta)$	4
Field strength in the initial radius	0.5 kG
Field strength in the final radius	0.510 kG
Injection energy	20 - 40 KeV
Critical energy (total)	1 MeV
Final energy (total)	MeV

The frequencies of free particle oscillations were found to be $\nu_x \approx 3$ and $\nu_z \approx 1.8$, which are lower than the theoretical value. The machine can also be used for studying the behavior of the particle beam and its accumulation. A cross-sectional view of the electromagnet is shown in Fig. 1. A pressure of $1 - 2 \cdot 10^{-6}$ mm Hg prevailed in the vacuum chamber. The injection system is designed both for pulsed and continuous operation. Acceleration is effected by an electric rotating field of 500 cps and 10 - 25 v per revolution. A special "speed up" system (rotating field of 600 v per revolution) serves for improving the electron-capture efficiency.

B111/B112

Annular proton synchrotron with ...

The pulse, which is excessively increased by the "speed up" process, is reduced by a thyatron circuit. A constant value of k could be attained with a theoretically calculated arrangement of the field coils along the ideal orbit. In addition to the principal coils, a coil was placed at the yoke of each sector, by which the influence of the iron resistance was eliminated. k and the azimuthal field distribution were measured with induction coils and a ballistic galvanometer. With a few exceptions, the values of k agreed with theoretical values to within $\pm 1\%$. The azimuthal inhomogeneity of the field was never greater than $\pm 1\%$. The position of the magnetic surfaces was determined with Permalloy feelers with an error of 0.2 mm. The deviation from the theoretical values was never greater than 0.5 mm. The indication of the beam during the first revolutions (without acceleration) was carried out with screens and coordinate nets in the chamber, and later (with acceleration) with photomultipliers equipped with radially adjustable sets of targets. The measurements showed that the field is strongly affected by the induction and "speed-up" core (e.g., azimuthal inhomogeneity). It was found that under optimum conditions, the upward deviation of the beam from the center of the chamber did not exceed ± 4 mm, and that the deviation of the equilibrium

TITLE: On freezing of water drops with silver iodide ²¹₁₃

SOURCE: AN GrazSSR. Soobshcheniya. v. 36, no. 3, 1964, 555-559 _B

TOPIC TAGS: meteorology, climatology, cloud, cloud crystallization, atmosphere

ABSTRACT: The results of experiments performed to study the freezing of water drops in the presence of suspensions of silver iodide, both with and without the presence of an electrical field, are presented. The silver chloride suspensions were prepared in a distilled water base in the proportion of 1 gram/liter. Drops of diameter 500-1000 μ microns containing AgI particles were fixed to a fine filament of diameter 20-25 μ and placed in a chamber 2100 cm³ in volume. Cooling within the chamber took place at a controlled rate of 1 degree/min. Very sensitive temperature measuring equipment was used in the experiments, as the beginning of phase transition to freezing is detected by a minute increase in temperature. Techniques of microphotography by reflected polarized light beams were used to record various events in the processes, and identification of different stages in the freezing process was in accordance with the methods proposed by N. V. Glik, A. A. Yeliseyev, N. M. Marchenko (Obrazovaniye monokristal'noy granuly l'da pri zamerzanii

AUTHORS: Shishkin, N. I.; Milagin, M. F.; Gabarayeva, A. D.

TITLE: Molecular network and orientation processes in amorphous polystyrene

SOURCE: Fizika tverdogo tela, v. 5, no. 12, 1963, 3453-3462

TOPIC TAGS: polystyrene, amorphous polystyrene, polymer, linear polymer, molecular network, elasticity, birefringence

ABSTRACT: The authors' purpose has been to study the processes of orientation and stretching in linear polymers. The study was made on atactic unfractionated polystyrene. Data were obtained on double refraction and elasticity for average molecular weights of $9 \cdot 10^4$, $2 \cdot 10^5$, and $7 \cdot 10^5$. It was shown that in the temperature interval 110-180C, with specimens being stretched for periods ranging from 2 to 1800 seconds in the region of linear strain dependence, highly elastic deformation of the polymer took place, with no indications of irreversible deformation. It was shown that Brewster's law held under these conditions. The experimental data were considered in light of the kinetic theory of photoelastic properties of rubber. It was concluded that the number of stress nodes in the molecular network

Card 1/2

ACCESSION NR: AP4004850

per unit volume of amorphous oriented polymer diminished markedly with rise in temperature and passage of time (during interval of stretching) and with decrease in average molecular weight of the polymer. It was further concluded that, by varying the conditions of stretching, unfractionated polymer samples and fibers may be obtained that are oriented at the expense of all the molecules or of only the large molecules in the polymer. Orig. art. has: 9 figures, 2 tables, and 7 formulas.

TITLE: The change in double refraction during annealing of oriented polystyrene

SOURCE: Fizika tverdogo tela, v. 6, no. 5, 1964, 1413-1417

TOPIC TAGS: double refraction, polystyrene, annealing, hyperelastic deformation, disorientation

ABSTRACT: The temperature and time dependence of double refraction and hyperelastic deformation during annealing of oriented samples of polystyrene were studied. It was found that the double refraction of oriented samples depends both on the annealing temperature and on the duration of the annealing process. When samples with unattached ends are annealed (for any fixed period of annealing) the dependence of the relative degree of orientation on temperature is the same for all samples oriented under different conditions. As a result, complete disorientation of samples reaches completion at approximately the same temperature. When annealing samples with definite lengths, the dependence of orientation on temperature for any definite annealing period is different for samples oriented under different conditions. The same is true for dependence of orientation on duration of annealing

Card

ACCESSION NR: AP4034921

at some constant temperature. The temperature and duration of annealing for complete disorientation are greater the higher the molecular weight of the chain and the molecular weight of the polymer. In annealing, as well as in pulling, samples of a linear amorphous polymer may have simultaneously greater hyperelastic deformation and practically no double refraction. Orig. art. has: 5 figures and 2 tables.

TITLE: Rupture strength and double refraction of polystyrene

SOURCE: Fizika tverdogo tela, v. 6, no. 12, 1964, 3636-3639

TOPIC TAGS: polystyrene, polymer chain, polymer rheology, rupture strength

ABSTRACT: This is a continuation of earlier work (FTT v. 4, 2681, 1962 and v. 5, 3453, 1963) on solid oriented polymers whose properties depend on such parameters as the number of chains or knots of the molecular grid and also the molecular weight of the chain. It was shown earlier (FTT v. 6, 1413, 1964 and v. 6, 1413, 1964) that the rate of relaxation of the oriented polymer during the course of its annealing and drawing is connected with these parameters. In the present article the effect of these

Card 1/4

L 18246-65

ACCESSION NR: AP5000663

0

parameters on the rupture strength of a solid oriented polymer is investigated. Oriented samples of polystyrene were produced by drawing samples of amorphous polystyrene at a fixed temperature and for a fixed time, and rapidly cooling to room temperature under load. The double refraction was measured at 20C. The drawing conditions were varied in such a way that the molecular weight of the chains in the sample ranged from 6×10^5 to 2×10^5 . The rupture strength of the samples was measured at 20 and -195C at an approximate rate of 100%/min. The results have shown that the drawing conditions are determined by a function whose parameters are the temperature of the polymer and the time during which the drawing takes place. If the drawing conditions of the polystyrene sample are identical, the molecular weight of the chain remains the same. The variation of the rupture strength with the double refraction is shown in Fig. 1 of the enclosure. An analysis of the results shows that the knots of the grid are defects which reduce the strength of

Card 2/4

L 18246-65

ACCESSION NR: AP5000663

the solid oriented polymer. It is also found that the strength of solid samples having a degree of drawing 0--1,000% (obtained without plastic deformation) and almost zero double refraction is equal to the strength of the unoriented non-annealed polymer. Orig. art. has 3 figures, and 1 formula.

"Instruments for Measurement of Aerosol Concentrations Used in the Control of Hygiene in Prague."

Prague, Pracovni Lekarstvi, Vol 18, No 10, Dec 66, pp 442-444

Abstract [Authors' English summary modified]: An instrument designed by the authors is described; it is based on particle filtration by a membrane filter. Light transparency of the filter is recorded. The accumulation of the particles on the membrane influences the amount of light passing through it. The accumulation is proportional to the amount of particles contained in the atmosphere. Evaluation of the results is made by a gravimetric analysis. The recorded curve is used for the determination of the relative amounts of aerosols in the air during the investigated period of time. The instrument has an accuracy of + 5%. 3 Figures, no references. (Manuscript received 6 Nov 65).

Translation from: Referativnyy zhurnal. Elektrotehnika, 1957, Nr 6, p 76 (USSR)

AUTHOR: Gabashvili, N. V.

TITLE: Electro-Hydraulic Governor for Automatic Control of Frequency and Interchange Powers in Interconnected Power Systems (Elektrogidravlicheskiy pervichnyy regulyator dlya avtomaticheskogo regulirovaniya chastoty i obmennykh moshchnostey ob'yedinennykh energosistem)

PERIODICAL: Tr. Gruz. politekhn. in-ta, 1956, Nr 2 (43), pp 25-40

ABSTRACT: In view of the essential inadequacy of governors (a considerable -- 4-6% -- statism*, comparatively large delays in activation, presence of an isodromic mechanism and secondary regulation), it is expedient to base regulation on the instantaneous frequency deviation (Δf) or on the rate of change of frequency (df/dt). An electro-hydraulic governor is suggested for this purpose that differs from a conventional governor by the absence of mechanical feedback and isodromic device. A phase-response circuit comprising magnetic amplifiers with five control windings connected in a differential circuit is a fundamental element of the governor; comparison of

* proportional band (in percent of the scale range).

Card 1/3

SOV/112-57-6-12217

Electro-Hydraulic Governor for Automatic Control of Frequency and

incoming signals is performed on the resistors connected to the diagonal of the circuit. Another version of the electro-hydraulic governor with an instantaneous frequency-deviation pickup is suggested. The frequency is controlled on the basis of an astatic characteristic. Interchange-power regulation is performed on the basis of a static relationship between the frequency and the interchange power. If the load changes in a given power system, its master station regulation is performed on the basis of an astatic characteristic; if the load changes in an adjacent system, the station regulation is performed according to a static characteristic. The dispatcher of the power system has an instantaneous frequency-deviation pickup and an interchange-power deviation summator. Signals from the above instruments are fed to a special potentiometer which reflects the share of the station in taking load fluctuations within the power system and also in regulating the exchange powers. The signal from the share potentiometer is transmitted to a load-distribution potentiometer installed at the master station. The output voltage of the latter is fed to a device that controls the shift of the electro-hydraulic-governor characteristic.

Card 2/3

SOV/112-57-6-12217

Electro-Hydraulic Governor for Automatic Control of Frequency and

With one master station in the power system, there is no need for the dispatcher's pickup. The control winding of the magnetic amplifier of the electro-hydraulic governor, which was associated with the electric-power meter, is now connected to the load-distribution potentiometer; this establishes a static relationship between the angular velocity of the generators and the interchange power. According to the author, the use of an electro-hydraulic governor tends to increase the quality and response of regulation, providing a simultaneously simple and economical solution of the problem from the telemechanical standpoint.

ABSTRACT:

Grigoriy Artem'yevich Sisoyan began his scientific career at the Vsesoyuznyy elektrotekhnicheskiy institut (All-Union Institute of Electrical Engineering). From 1932 he works as a scientist and as a teacher at the Chair of General and Theoretical Electrical Engineering at the Gruzinskiy politekhnicheskiy institut im. Kirova (Georgian Polytechnic Institute imeni Kirov). At the same time he works as an engineer at the Gruzenergo. From 1937 he devoted himself to electrothermal processes and theoretical electrical engineering. He solved a number of problems connected with the processes occurring in the electrical part of large ferro-alloy and carbide furnaces. In 1946 he was promoted Doctor of Technical Sciences. His Dissertation dealt with the electrical phenomena in the bath

TOPIC TAGS: electrohydraulic regulator, power regulator, frequency regulator

TRANSLATION: Measuring and amplifying units are described of an electrohydraulic frequency and power regulator used in power systems. A regulator block diagram, a magnetic-amplifier measuring circuit, and a transistorized measuring and amplifying circuit are explained. The above units comprise: a primary-parameter input and summation unit, a phase-sensitive circuit, an amplifier, and external feedback, and a damper. A resonant circuit is used as a frequency sensor. Power is measured by an MDM-4 sensor. The total a-c control signal is converted into a d-c signal and applied to the amplifier and then to the actuating unit. The magnetic
